

CS380: Introduction to Computer Graphics Introduction to OpenGLSL

Min H. Kim
KAIST School of Computing

Min H. Kim (KAIST) *Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012*

OpenGL Program Skeleton

- Typical OpenGL-Application:

```

graph TD
    Start[Start Application] --> main[main()]
    main --> init[init()]
    main --- Exit[Exit application]
    main --- MainLoop[Main-loop]
    MainLoop --> update[update()]
    update --> render[render()]
    render --> update
    MainLoop --> cleanup[cleanup()]
  
```

Min H. Kim (KAIST) *Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012*

OpenGL Program Skeleton

- **main():**
 - Program-Entry
 - Create window
 - Call init()
 - Start main window-loop Call cleanup()
 - Exit application
- **init():**
 - Initialize libraries, load config-files, ...
 - Allocate resources, preprocessing, ...

Min H. Kim (KAIST) *Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012*

OpenGL Program Skeleton

- **update():**
 - Handle user-input, update game-logic, ...
- **render():**
 - Do actual rendering of graphics here!
 - Note: Calling render() twice without calling update() in between should result in the same rendered image!
- **cleanup():**
 - Free all resources

Min H. Kim (KAIST) *Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012*

OpenGL Program Skeleton

- Example init()-function:

```
void init() {
    // Create and initialize a window with depth-buffer and
    // double-buffering. See your window-managers documentation.

    // enable the depth-buffer in OpenGL
    glEnable(GL_DEPTH_TEST);

    // enable back-face culling in OpenGL
    glEnable(GL_CULL_FACE);

    // define a clear color
    glClearColor(0.0f, 0.0f, 0.0f, 0.0f);

    // set the OpenGL-viewport
    glViewport(0, 0, windowWidth, windowHeight);

    // Do other useful things
}
```

OpenGL Program Skeleton

- The **geometry** of a 3D-object is stored in an array of vertices called **Vertex-Array**.
- Each vertex can have so called **Attributes**, like a **Normal Vector** and **Texture-Coordinates**.
- OpenGL also treats **vertices** as **attributes**!
- To render geometry in OpenGL, vertex-(attribute)-arrays are passed to OpenGL and then rendered.

OpenGL Program Skeleton

- To do so:
 - Query the attribute-location in the shader:

```
GLint vertexLocation = glGetAttribLocation(
    myShaderProgram, "in_Position");
```
 - Enable an array for the vertex-attribute:

```
glEnableVertexAttribArray(vertexLocation);
```
 - Then tell OpenGL which data to use:

```
glVertexAttribPointer(vertexLocation, 3, GL_FLOAT,
    GL_FALSE, 0, myVertexArray);
```

OpenGL Program Skeleton

- Draw ("render") the arrays:

```
glDrawArrays(GL_TRIANGLES, 0, 3); // this does the
    actual draw
```
- Finally disable the attribute-array:

```
glDisableVertexAttribArray(vertexLocation);
```

OpenGL Program Skeleton

- Example render()-function:

```
// triangle data
static GLfloat vertices[] = { -0.5, -0.333333, 0, // x1, y1, z1
                             +0.5, -0.333333, 0, // x2, y2, z2
                             +0.0, +0.666666, 0}; // x3, y3, z3

...

void render() {
    // clear the color-buffer and the depth-buffer
    glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT);

    // activate a shader program
    glUseProgram(myShaderProgram);

    // Find the attributes
    GLint vertexLocation = glGetAttribLocation(
        myShaderProgram, "in_Position");
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

9

OpenGL Program Skeleton

```
// enable vertex attribute array for this attribute
glEnableVertexAttribArray(vertexLocation);

// set attribute pointer
glVertexAttribPointer(vertexLocation, 3, GL_FLOAT,
                     GL_FALSE, 0, vertices);

// Draw ("render") the triangle
glDrawArrays(GL_TRIANGLES, 0, 3);

// Done with rendering. Disable vertex attribute array
glDisableVertexAttribArray(vertexLocation);

// disable shader program
glUseProgram(0);

// Swap buffers
}
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

10

OpenGL-Object life-cycle

- In OpenGL, all objects, like **buffers and textures**, are somehow treated the same way.
- On object creation and initialization:
 - First, create a **handle** to the object (in OpenGL often called a name). Do this ONCE for each object.
 - Then, **bind** the object to make it **current**.
 - **Pass data** to OpenGL. As long as the data does not change, you only have to do this ONCE.
 - **Unbind** the object if not used.

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

11

OpenGL-Object life-cycle

- On rendering, or whenever the **object** is used:
 - **Bind** it to make it current.
 - **Use** it.
 - **Unbind** it.
- Finally, when object is not needed anymore:
 - **Delete** object.
 - Note that in some cases you manually have to delete attached resources!
- **NOTE: OpenGL-objects are NOT objects in an OOP-sense!**

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

12

What shaders are

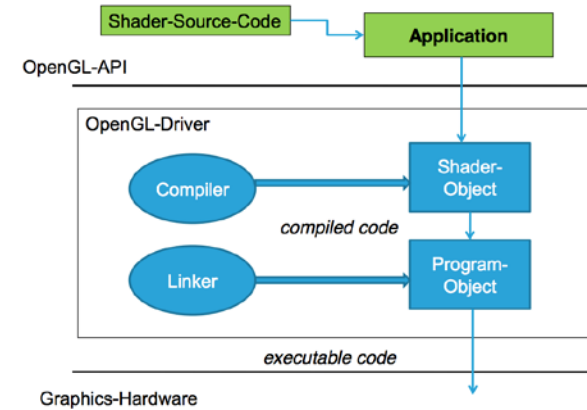

- **Small C-like programs** executed on the **graphics-hardware**
- Replace fixed function pipeline with shaders
- Shader-Types
 - **Vertex** Shader (VS): per **vertex** operations
 - **Geometry** Shader (GS): per **primitive** operations
 - **Fragment** Shader (FS): per fragment (**pixel**) operations, so-called **Pixel** Shader
- Used e.g. for transformations and lighting

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

13

Shader-Execution model

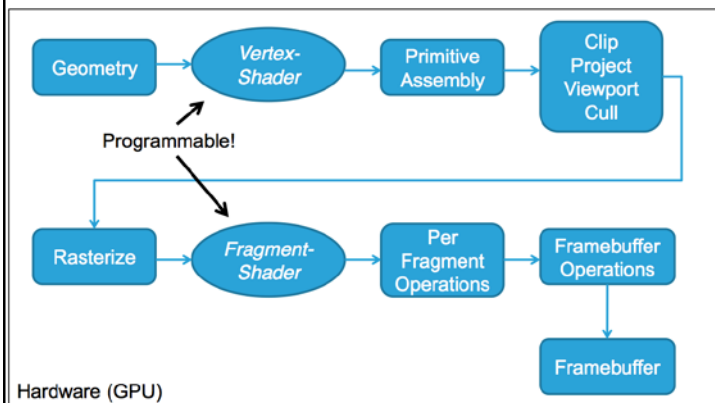

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

14

Rendering-Pipeline

- OpenGL 3.x Rendering-Pipeline:

Hardware (GPU)

Rendering-Pipeline

- Remember:
 - The **Vertex-Shader** is executed **ONCE** per **each vertex!**
 - The **Fragment-Shader** is executed **ONCE** per **rasterized fragment (~ a pixel)!**
- A Shader-Program consists of both,
 - One VS
 - One FS

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

16

Setting up shaders and programs

- Compile shaders:

```
char* shaderSource; // contains shadersource
int shaderHandle = glCreateShader(GL_SHADER_TYPE);

// shader-types: vertex || geometry || fragment
glShaderSource(shaderHandle, 1, shaderSource, NULL);
glCompileShader(shaderHandle);
```
- Create program and attach shaders to it:

```
int programHandle = glCreateProgram();
glAttachShader(programHandle, shaderHandle);
// do this for vertex AND fragment-shader (AND geometry if
needed)!
```
- Finally link program:

```
glLinkProgram(programHandle);
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

17

Enabling shaders

- Enable a GLSL program:

```
glUseProgram(programHandle); // shader-program
now active
```

 - The active shader-program will be used until `glUseProgram()` is called again with another program-handle.
 - Call of `glUseProgram(0)` sets no program active (undefined state!).

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

18

Basic shader layout

- Shader-Programs must have a `main()`-method
- Vertex-Shader outputs to at least `gl_Position`
- Fragment-Shader to custom defined output

```
//preprocessor directives like:
#version 150
```

```
//variable declarations
```

```
void main() {
    //do something and write into output variables
}
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

19

Shader Parameter

- Shader variable examples:

```
uniform mat4 projMatrix; // uniform input
in vec4 vertex; // attribut-input
out vec3 fragColor; // shader output
```
- Three types:
 - **uniform**: does not change per primitive; read-only in shaders
 - **in**: VS: input changes per vertex, **read-only**; FS: interpolated input; **read-only**
 - **out**: shader-output; VS to FS; FS output.

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

20

Uniform Parameter

- Set uniform parameters in an application:

```
// first get location
projMtxLoc = glGetUniformLocation(programHandle,
    "projMatrix");

// then set current value
glUniformMatrix4fv(projMtxLoc, 1, GL_FALSE,
    currentProjectionMatrix);
```

 - First get the „location“ of the uniform-variable
 - Then set the current value
 - Can pass values to vertex- and fragment-shader

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

21

Attribute Parameter

- A **vertex** can have attributes like a **normal-vector** or **texture-coordinates**
- OpenGL also **treats** the **vertex** itself as an **attribute**
- We want to access our current vertex within our vertex-shader (as we used to do with `gl_Vertex` in former GLSL-versions):
- Therefore, we declare in our vertex-shader:

```
in vec4 vertex; // vertex attribut
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

22

Attribute Parameter

- Now, there are two ways to pass data to this shader attribute-variable, depending on:
 - if you just have an array of vertices (**Vertex Array**),
 - or an **VBO (Vertex Buffer Object)**.
- To do so: Query shader-variable location
 - Enable vertex-attribute array
 - Set pointer to array
 - Draw and disable array

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

23

Attribute Parameter: Vertex-Array

- For a Vertex-Array, pass data like this:

```
// first get the attribute-location
vertexLocation = glGetAttribLocation(programHandle, "vertex");

// enable an array for the attribute
glEnableVertexAttribArray(vertexLocation);

// set attribute pointer
glVertexAttribPointer(vertexLocation, 3, GL_FLOAT, GL_FALSE, 0,
    myVertexArray);

// Draw ("render") the triangle
glDrawArrays(GL_TRIANGLES, 0, 3);

// Done with rendering. Disable vertex attribute array
glDisableVertexAttribArray(vertexLocation);
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

24

Attribute Parameter: VBO

- Setting attribute parameters with VBO:

```
// first get location
vertexLocation = glGetAttribLocation(programHandle, "vertex");

// activate desired VBO
glBindBuffer(GL_ARRAY_BUFFER, vertexBuffer);

// set attribute-pointer
glVertexAttribPointer(vertexLocation, 4, GL_FLOAT, GL_FALSE,
0, 0);

// finally enable attribute-array
glEnableVertexAttribArray(vertexLocation); ...
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

25

Fragment Output

- Since GLSL 1.3, `gl_FragColor` is deprecated.
- Therefore, need to define output on our own.
- Declare output variable in FS:

```
out vec4 fragColor; // fragment color output
```
- In the application, before linking the shader-program with `glLinkProgram()`, bind the FS-output:

```
glBindFragDataLocation(programHandle, 0,
"fragColor");
```
- Finally assign a value to `fragColor` in the FS.

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

26

Example usage

- An application using shaders could basically look like this:

```
//Load shader and initialize parameter-handles

//Do some useful stuff like binding texture, activate
//texture-units, calculate and update matrices, etc.

//glUseProgram(programHandle);

//Set shader-parameters
//Draw geometry

//glUseProgram(anotherProgramHandle);
...
```

Min H. Kim (KAIST)

27

Appendix A

HELLO WORLD 2D

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

28

Assignment1

- **HW1 Deadline: 2015.3.12(Thur.) 23:55**
- Go to the course website and download the files: hw2d.pdf, hw2d.zip in Week1
- Solve the three tasks (described in the pdf) and submit your codes with some screenshots to the TA by email.
- **Yeong Beum Lee**
(yblee@vclab.kaist.ac.kr)

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

29

Quiz1

- **15/3/11 (Wed.) Quiz1 about what we learned about OpenGL**

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

30

Code (hw2d.zip)

- we use c++
 - see 'C++ primer'.
- now we look at the code from the textbook
- Core codes:
 - asst1.cpp
 - glsupport.h/.cpp
 - asst1-gl3.fshader
 - asst1-gl3.vshader
- Auxiliary codes:
 - ppm.h/.cpp

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

31

Code (hw2d.zip)

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

32

asst1.cpp

- Set `g_GL2Compatible = true` to use GLSL 1.0 and `g_GL2Compatible = false` to use GLSL 1.3.
- on Mac OS X currently there is no way of using OpenGL 3.x with GLSL 1.3 when GLUT is used.
- If `g_GL2Compatible=true`, shaders with `-gl2` suffix will be loaded.
- If `g_GL2Compatible=false`, shaders with `-gl3` suffix will be loaded.
- To complete the assignment you only need to edit the shader files that get loaded

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

33

asst1.cpp

- How to check the version you have

```
cout << "GL ver: " << glGetString(GL_VERSION) << "\n";
cout << "GLEW ver: " << glewGetString(GLEW_VERSION) << "\n";
cout << "GLSL ver: " <<
glGetString(GL_SHADING_LANGUAGE_VERSION) << "\n";
```
- Outputs

```
GL ver: 2.1 NVIDIA-8.12.47 310.40.00.05f01
GLEW ver: 1.10.0
GLSL ver: 1.20
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

34

asst1.cpp

```
int main(int argc, char **argv) {
    try {
        initGlutState(argc,argv);
        glewInit(); // load the OpenGL extensions

        initGLState();
        initShaders();
        initGeometry();
        initTextures();

        glutMainLoop();
        return 0;
    }
    catch (const runtime_error& e) {
        cout << "Exception caught: " << e.what() << endl;
        return -1;
    }
}
```

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

35
