

CS380: Introduction to Computer Graphics  
Smooth Interpolation  
Chapter 9

Min H. Kim  
KAIST School of Computing

Min H. Kim (KAIST) *Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012*

## Assignment

- **HW4 Deadline:**  
**2015.4.16 (Thur.) 23:55**
- Go to the course website and download the files
- Solve the tasks (described in the pdf) and submit your codes with some screenshots to the TA by email.
- **Yeong Beum Lee**  
[yblee@vclab.kaist.ac.kr](mailto:yblee@vclab.kaist.ac.kr)

Min H. Kim (KAIST) *Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012*

Quaternion II

## SUMMARY

Min H. Kim (KAIST) *Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012*

## RBT Interpolation Behavior

- Even though the quaternion rotation is left and right invariant, the quaternion rotation + object translation is left invariant.
- The translation of the origin plays special role.
- If we use different object frames for same geometry, we get different interpolations
  - Not right invariant

Min H. Kim (KAIST) *Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012*

## Mental model

- Define the unit direction vectors  $\vec{v}_1, \vec{v}_2$  :  
normalize  $(\tilde{p}_1 - \tilde{o})$  and normalize  $(\tilde{p}_2 - \tilde{o})$   
respectively.

- Define the angle

$$\phi = \arccos(\vec{v}_1 \cdot \vec{v}_2)$$

- Define the axis

$$\vec{k} = \text{normalize}(\vec{v}_1 \times \vec{v}_2)$$

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MI

5

## The balls

- Trackball:  $M$  is the rotation of  $\phi$  degrees about the axis  $\vec{k}$ .
- Arcball:  $M$  is the rotation of  $2\phi$  degrees about the axis  $\vec{k}$ .
- Could be implemented with matrices or quaternions.
- Arcball is very easy with quaternions

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

6

## Getting eye coordinates

- Given the  $(x,y)$  window coordinates of click, the  $z$  coordinate on the sphere can be solved using

$$(x - c_x)^2 + (y - c_y)^2 + (z - 0)^2 = r^2$$

$$z = \sqrt{r^2 - (x - c_x)^2 - (y - c_y)^2}$$

- $[c_x, c_y, 0]^t$  are the window coordinates of the center of the sphere
- $r$  is the radius of the sphere measured in pixels
- if outside of the sphere, then clamp to its boundary
- All we need is normalized  $\hat{v}$ , so just normalized such vectors

Chapter 9

## SMOOTH INTERPOLATION

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

8

## Keyframe animation

Starting keyframe    ...    Ending keyframe    Completed animation

- An animator describes snapshots of a 3D computer graphics animation at a set of discrete times.
  - So-called *key frames*

Min H. Kim (KAIST)    Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012    9

## Keyframe animation

Starting keyframe    ...    Ending keyframe    Completed animation

- Each keyframe is defined by some set of modeling parameters.
  - In our case, this is a bunch of RBTs.
  - The translations are 3 real scalars.
  - The rotations are quaternions.

Min H. Kim (KAIST)    Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012    10

## Keyframe animation

Starting keyframe    ...    Ending keyframe    Completed animation

- To create a smooth animation, the computer's job is to smoothly 'fill in' the parameter values over a continuous range of times.

Min H. Kim (KAIST)    Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012    11

## Interpolation

- Let one of these animated parameters be called  $c$ , and each of our discrete snapshots is called  $c_i$  where  $i$  is some range of integers
- Our job is to go from the  $c_i$  to a continuous function of time,  $c(t)$ 
  - We will typically want the function  $c(t)$  to be sufficiently smooth, so that the animation does not appear too jerky.

Min H. Kim (KAIST)    Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012    12

## Interpolation

- We show a function  $c(t)$ , with  $t \in [0..8]$  that interpolates the discrete values associated with the integers  $c_i$  with  $t \in [-1..9]$ 
  - The need for the extra non-interpolated values at -1 and 9 will be made clear later
- Until now, we have used piecewise linear interpolation, which is not smooth!

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gort

13

## Splines

- Our spline is made up of individual pieces, where each piece is some low-order polynomial function
- These polynomial pieces will be selected so that they 'stitch up' smoothly.
- Easy to present, evaluate and control.
  - Spline behavior much easier to predict than, say, a single high-order polynomial function.

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gort

14

## Splines

- Also useful for curves in the plane (e.g., fonts) and space, and the basis for theory of smooth surfaces in space.

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gort

15

## Cubic Bezier function

- We start by just looking at how to represent a cubic polynomial function  $c(t)$  with  $t \in [0..1]$
- We will talk about the Bezier representation
  - The parameters have a direct geometric interpretation
  - Evaluation reduces to repeated linear interpolation.

Min H. Kim (KAIST)

Foundations of 3D Computer Graphics, S. Gort

16

### Bezier control polygon

- We will specify a cubic function using four 'control values'  $c_0, d_0, e_0,$  and  $c_1$ 
  - Visualized as points in the 2D  $(t, c)$  plane
  - With coordinates of four points:  $[0, c_0]^t, [1/3, d_0]^t, [2/3, e_0]^t,$  and  $[1, c_1]^t$
  - We have also drawn in light blue a poly-line connecting these points; this is called the control polygon.

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Go

### Bezier evaluation

- To evaluate the function  $c(t)$  at any value of  $t$ , we perform the following sequence of linear interpolations:
 
$$f = (1-t)c_0 + td_0$$

$$g = (1-t)d_0 + te_0$$

$$h = (1-t)e_0 + tc_1$$

$$m = (1-t)f + tg$$

$$n = (1-t)g + th$$

$$c(t) = (1-t)m + tn$$

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Go

### Bezier properties

- By unwrapping the evaluation steps before, we can verify  $c(t)$  has the form:
 
$$c(t) = c_0(1-t)^3 + 3d_0t(1-t)^2 + 3e_0t^2(1-t) + c_1t^3$$
- It is a cubic function
- The  $c_i$  are interpolated:
 
$$c(0) = c_0 \text{ and } c(1) = c_1$$

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Go

### Bezier properties

- Let's take the first-order derivatives:
 
$$c(t) = c_0(1-t)^3 + 3d_0t(1-t)^2 + 3e_0t^2(1-t) + c_1t^3$$

$$c'(t) = 3c_1t^2 - 3e_0t^2 - 3c_0(t-1)^2 + 3d_0(t-1)^2 - 6e_0t(t-1) + 3d_0t(2t-2)$$
- We see that  $c'(0) = 3(d_0 - c_0), c'(1) = 3(c_1 - e_0)$
- We see indeed that the slope of  $c(t)$  matches the slope of the control polygon at 0 and 1.

```

syms a b c d t
f(t) = a*(1-t)^3 + 3*b*t*(1-t)^2 + 3*c*t^2*(1-t) + d*t^3
df = diff(f)
df(0) = 3*b - 3*a
df(1) = 3*d - 3*c
    
```

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Go

## Bezier properties

- If we set  $c_0 = d_0 = e_0 = c_1 = 1$ , then  $c(t) = 1$  for all  $t$ 
  - This property is called partition of unity
  - Means that adding a constant value to all control values results in simply adding this constant to  $c(t)$

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Go

## Translated domain

- If we want a cubic function to interpolate value  $c_i$  and  $c_{i+1}$  at  $t = i$  and  $t = i + 1$ , respectively, and calling our two other points  $d_i$  and  $e_i$ ,
- We just have to 'translate' the evaluation algorithm to get

$$f = (1-t+i)c_i + (t-i)d_i$$

$$g = (1-t+i)d_i + (t-i)e_i$$

$$h = (1-t+i)e_i + (t-i)c_{i+1}$$

$$m = (1-t+i)f + (t-i)g$$

$$n = (1-t+i)g + (t-i)h$$

$$c(t) = (1-t+i)m + (t-i)n$$

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Go

## Translated domain

- Within the range  $i..i+1$  this looks just like the untranslated algorithm operating on the fractional component.

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Go

## Cubic Bezier Splines

<http://www.math.ucla.edu/~baker/java/hoefler/Spline.htm>

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

24

## Catmull-Rom Splines (CRS)

- Let us return now to our original problem of interpolating a set of values  $c_i$  for  $i \in -1..n+1$
- The 'Catmull-Rom splines' defines a function  $c(t)$  for values of  $t \in [0..n]$
- The function is defined by  $n$  cubic functions, each supported over a unit interval  $t \in [i..i+1]$
- The pieces are chosen to interpolate the  $c_i$  values, and to agree on their first derivatives.

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

25

## CRS construction

- Each cubic function is described in its Bezier representation, using four control values:  $c_i, d_i, e_i,$  and  $c_{i+1}$
- From our input data, we already have the  $c_i$  values.
- To set the  $d_i$  and  $e_i$  values we impose the constraint  $c'(t)|_i = \frac{1}{2}(c_{i+1} - c_{i-1})$ 
  - We look forward and backwards one sample to determine its slope at  $t = i$ ;
  - This is why we need the extra c-values

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

26

## CRS construction

- This also can be stated as  $c'(t)|_{i+1} = \frac{1}{2}(c_{i+2} - c_i)$
- Since  $c'(i) = 3(d_i - c_i)$  and  $c'(i+1) = 3(c_{i+1} - e_i)$ , in the Bezier representation, this tells us that we need to set:

$$d_i = \frac{1}{6}(c_{i+1} - c_{i-1}) + c_i$$

$$e_i = \frac{-1}{6}(c_{i+2} - c_i) + c_{i+1}$$

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

## Catmull-Rom Splines

3

0

<http://www.cse.unsw.edu.au/~lambert/splines/CatmullRom.html>

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012

28

## Quaternion Splining

- Time-varying translation ( $t_x, t_y$  and  $t_z$ )
- Splines are based on scalars, or vectors.
- Theory does not directly apply (ongoing research)
- If we want to interpolate a set of quaternions we need to hack by association
- [Hacking] Substitute appropriate quaternion operations for the scalar operations
  - Bezier scalar addition → quaternion multiplication
  - Bezier scalar negation → quaternion inversion
  - Bezier scalar multiplication → quaternion power

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012 29

## Quaternion Splining

- Bezier evaluation steps of the form:
 
$$r = (1 - t)p + tq$$
- Become:  $r = \text{slerp}(p, q, t)$
- And the  $d_i$  and  $e_i$  equation values are defined as
 
$$d_i = ((c_{i+1}c_{i-1}^{-1})^{1/6})c_i \quad \Leftarrow d_i = \frac{1}{6}(c_{i+1} - c_{i-1}) + c_i$$

$$e_i = ((c_{i+2}c_i^{-1})^{-1/6})c_{i+1} \quad \Leftarrow e_i = \frac{-1}{6}(c_{i+2} - c_i) + c_{i+1}$$
- In order to interpolate “the short way”, we do conditional negation on  $(c_{i+1}c_{i-1}^{-1})$  before applying the power operator.

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012 30

## Curves

- We can cleanly apply the scalar theory to describe curves in the plane or space.
- The spline curve is controlled by a set of *control points*  $\tilde{c}_i$  in 2D or 3D.

Bezier curve (2D)

Catmull-Rom curve (2D)

Min H. Kim (KAIST) S. S. Gortler, MIT Press, 2012 31

## Curves

- Applying the spline construction independently to the  $x$ ,  $y$  and  $z$  coordinates, one gets a point-valued spline function  $\tilde{c}_i$ ;
- Think of this as a point flying through space over time, tracing out the spline curve,  $\gamma$ .
- This can be further developed into a theory for surfaces.

Min H. Kim (KAIST) Foundations of 3D Computer Graphics, S. Gortler, MIT Press, 2012 32
